Program Requirements

2+ conditional statements

2+ uses of For Loops: main roads (and nested for loop for yellow paint?)

4+ distinct uses of Functions

3+ classes defined: player, car, tree

SCRAPPED

I want to recreate/prototype the board game I worked on during design week, hence the grid on screen. At the start of the game, players can place 3 monster tokens on the board as obstacles for other plays. Players can move their own character around the board and clear out the monsters by attacking them. I don't know how to add hitboxes yet, so saving this idea for the next assignment, but keeping the theme.

"New" Idea: whack-a-mole / monster

- Have the monsters pop up on screen and the player click on them or presses the corresponding button to defeat them.
- Have a non threatening object appear on screen that plays should ignore, but they can ko if they interact.

Grid colour (70,110,55)

Draw lines - for loop

as a class or array

Need to set up random locations for monsters to spawn, and have them be on screen for an interval of time.

Deciding to build on my 2nd Assignment with the car.

Draw Roads

color 125

yellow paint (239, 183, 0)

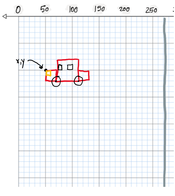

y= 760

y=

Do a forloop the main roads and a nested for loop for the yellow paint line.

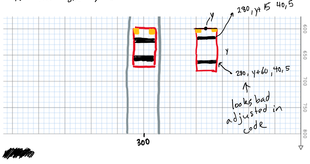

NPC cars

- copy the cars from assignment 2, change the y position into a variable, set up movement speed and looping back to the start of the window
- make head light and window positions change if car moves to the left (speed<0)

Player car

Draw shape to move along y, set it to loop back to the start, set it to move forward with space bar

Lanes and NPC car Y positions

- tried different y values until satisfied
  - car 4, try ~~x=185~~, try y=165

Draw Trees

Pine Tree (62, 134, 103)

Trunk (75, 40, 30)

1. x, y
2. x-10, y+20
3. x+10, y+20
4. x, y+10
5. x-10, y+30
6. x+10, y+30
7. x, y+20
8. x-10, y+40
9. x+10, y+40
10. x-5, y+40, 10,

Too SMALL DOUBLING
